

The Creates P.F.F. Ring Clasp, Don't be fooled by so called look a likes.

The P. F. F. is the only true ring lock. And the most powerful **dead lock** in jewelry.

Locking rings were never possible until 1989 when the P.F.F. was introduced.

Anybody could make a shank open, but locking it, was the key. **Interference fit is not a lock.**

Because there are (heavily advertised) look a likes that can be heard slapping together.

Doesn't mean that it has locked. There is no lock! It's a pretend lock.

If you notice they never stay closed, just pull to see. **They just fall off your finger.**

The P.F.F. works the same from size 2 to size 16 or whatever, as the lock works on an embedded spring system, which takes the load. There is no relation between the ring size, and locking ability. There are no restrictions on the width or size of the band. They all work well, and work the same. And there are no horns on the inside to scratch your finger.

Beware of cheap imitations using (Taiwan paper ring technology)

that don't really lock, they jiggle jiggle, galling the skid bumps, and don't last.

Galling is what happened in the chuck wagon days when two like materials wore away.

As shown in Geller's Blue Book To Jewelry Repair and Design

David Geller can be reached on Polygon.

His company is called: JewelerProfit, Inc.

510 Sutters Point, Suite 100.

Atlanta, Georgia, 30328
